SPOTLIGHT

Sunbird Spark

Sunbird Ed (the DPG for learning, skilling and capacity building) has evolved to its newest version — Sunbird Spark. Spark offers best-in-class DPG capabilities for the learning and skilling domains, in an efficient shape and form for all classes of adopters, while retaining the extensibility, scalability and reliability of Sunbird Ed — the core DPG that powered DIKSHA in India.

PRODUCT UPDATE

What Will You Spark?

A quick look at what's new in Sunbird Spark, and what's coming next:

Sunbird Spark just shipped v1.0.2 (8 July 2026), and the roadmap for the next two months adds further depth on personalization and AI.

Personalized Learning Journeys & Competency Frameworks

Spark will be able to assess a learner against a defined set of skills, pinpoint exactly which competencies they're missing, and build a learning journey to close those gaps. The design work is in progress, and build will commence shortly. Once a competency framework is mapped to Sunbird's taxonomy, Spark will automatically recommend the right content to help learners reach each competency — no manual curation needed.

Richer, More Flexible Assessments

QuML assessments now support all question types — Fill in the Blanks, Match the Following, Sequence Ordering, and Reordering — both online and offline — plus a new True/False question type. Authors can also save questions in any of four supported languages (English, Arabic, French, Spanish) by default. The authoring experience got faster too: the Collection, Generic/Upload, and QuML editors have been rebuilt in React, with expanded Arabic, French, and Portuguese support and full right-to-left layout.

AI at the Core

Spark has enabled MCP integration, providing a standard way to connect with AI tools and agents. We are building out the AI pipeline as core infrastructure — the backbone for running AI jobs at scale — with the initial set of AI jobs enabling automated caption and transcript generation as well as configurable metadata generation and tagging.

Under the Hood

v1.0.2 also strengthened the platform's foundations: a new on-demand tool lets operators refresh search indexes without redeploying the system, and 43 security vulnerabilities tied to component upgrades were resolved across the platform — keeping Spark reliable and secure for every deployment.

Take a look at the Sunbird Spark microsite to know more.

Join the Collective

As Spark continues its evolution — responding to market needs and integrating newer capabilities — we look to the community for inspiration and involvement. Partnership opportunities abound, and the team is looking forward to exciting collaborations!
